Project Title: Online Bookstore Management System

- **Business Idea:** An e-commerce information system designed to allow customers to browse books, add items to a shopping cart, place orders, and make payments, while allowing administrators to manage book inventory and track order fulfilment.

Problem Statement and Purpose

- **Problem Statement:** Traditional brick-and-mortar bookstores lack a digital platform to reach a wider customer base, leading to inefficient inventory tracking, manual order recording, and poor customer management.
- **Purpose:** The proposed system automates book browsing, inventory management, order processing, and customer record-keeping to enhance efficiency and user experience.

Project Scope

- **Functions Covered:** Customer registration and authentication, book catalog management, shopping cart operations, order placement, and payment processing.
- **Functions Excluded:** Physical warehouse logistics, third-party courier tracking integration, and multi-currency exchange rate conversions.

Main Classes and Their Responsibilities

- **Customer:** Represents registered users who can browse books, place orders, and manage their personal profiles.
- **Book:** Represents books available for purchase, storing inventory levels and pricing information.
- **ShoppingCart:** Acts as a temporary holding area for selected books prior to checkout.
- **Order:** Represents a confirmed purchase transaction made by a customer.
- **Payment:** Handles the financial transaction associated with a specific order.

Brief Description of System Requirements

- The system must securely store customer credentials and profile information.
- The system must allow users to search books by title, author, or category.
- The system must update book stock quantities automatically upon order placement.
